Housing removal tool

This tool is used to remove the MPO connector housing from the assembly, allowing correction of finished assemblies. The guide pin section of the tool accommodates both centered and offset MPO housing keys.
The tool features a compact design with a metal construction, making it ideal for use in production lines, test and engineering laboratories, as well as field installation.

The MPO housing can be rotated 180° to change the polarity of the assembly, converting it from single-polarity to dual-polarity.

The disassembly fixture saves time when reworking MT ferrule end faces, or when MPO guide pins and brackets need to be added or removed to adjust the gender of the MPO assembly.
